TITLE OF THE INVENTION

Gaming Device with Bingo Multiplier Bonus

REFERENCE TO PRIOR PROVISIONAL PATENT

This invention was submitted for a provisional patent, electronically, by the same inventor, John Fox, under the title "Bingo Multiplier" in provisional application number 60/481832 on the 26th of December, 2003.

BACKGROUND OF THE INVENTION

FIELD OF INVENTION

9-19534

The following invention is generally related to instrumentalities and methodologies in bingo gaming devices. More specifically, the invention is directed to a bingo gaming device, having or not Annotated Page -2-

04/10/2008 15:45 14027338489 AMERICAN AMUSEMENTS PAGE 25/49

having a winning outcome in which the player is rewarded, and a second triggering outcome allowing the player to receive a payout award. Such a gaming device may be utilized with multiple levels of "progressive" awards, with the level of the available multipliers based on the amount of the initial wager. As a consequence, awarding of the credits may be defined by a plurality of levels of progressive awards, wherein each level is dependent on the number of gaming propositions occurring simultaneously.

DESCRIPTION OF RELATED ART

In the game of bingo, each player is provided with a card that includes a matrix of five rows and five columns defining twenty-five grid squares. The left-most column is labeled "B", the second column "T", the third column "N", the fourth column "G" and the right-most column "O". Traditionally, each grid square, with the exception of the "free" center grid square, is labeled with a number in the range of 1 to 75. The grid squares in the "B" column use the numbers in the range of 1 to 15. The squares in the "I" column use the numbers in the range of 16 to 30. The grid squares in the "N" column, except the center square, use the numbers in the range of 31 to 45. The grid squares in the "G" column use the numbers in the range of 46 to 60. The grid squares in the "O" column use the numbers in the range of 61 to 75. Each grid square is defined by the combination of a letter identifying the column and a number. As a caller randomly calls combinations of columns and numbers, each player indicates which of that player's grid squares had been called, either through markings in the grid squares or placing items on the squares. The first person to achieve a pre-determined pattern of called grid squares is the winner of that game. Examples of patterns include: one straight line, two straight lines, the entire card, the border of the grid, etc.

The game of bingo has developed into a substantial form of gambling in which players purchase cards and winners are rewarded with prizes, frequently in the form of cash. The game is simple enough

Annotated Page -3-

04/10/2008 15:45 14027338489 AMERICAN AMUSEMENTS PAGE 26/49

for almost anyone to play and it gives the players a feeling of involvement in the game of chance. In a casino environment it is generally desirable to have the bingo games achieve a winner as frequently as possible so that more games can be played in a shorter time period. More games being played means that there will be more winners. Players who win periodically are more likely to continue playing. More games also mean more revenue for the house.

Various efforts have been made to speed up the games, other than just calling numbers faster. For example, some game cards, such as those sold under the trademark "Double Action Bingo" from Bonus Games, Inc., include two numbers in each square. In essence, two separate game cards have been combined into a single game card so that two games can be played at one time. Each game card has the opportunity to be a winner in two separate games called form the same set of numbers. Nevertheless, the basic game is still the same as traditional bingo.

It is an object of the invention to provide a bingo game that provides a winner with a specific number of called squares with the added incentive of receiving a multiplier bonus award.

The primary purpose of playing any game is to win the game. While a player may initially find enjoyment in trying to win a particular game, tedium sets in if no further stimulus is offered to entertain the player. Accordingly, several games have been developed that offer a "bonus" game for attaining a particular outcome, allowing the player the prospect of engaging in a different gaming proposition. Many bonus games, however, simply consist of playing a revised version of the initial game.

Additionally, "progressive" award games are offered by some developers, offering awards dependent on the number of players engaged in the participating machines. These add the excitement of obtaining a larger award, but are available only to players who employ maximum wagers. Such propositions are not stimulating to players who choose to play consistently, but with lower stakes.

BRIEF SUMMARY OF THE INVENTION

Accordingly, it is a primary object of the present invention to provide a new and novel device and method for gaming, in which a player has the opportunity to win a multiplier bonus for more chances at success.

It is a further object of the present invention to provide a device and method as characterized above which provides a player with the prospect of engaging in different types of gaining propositions in one gaming session.

It is a further object of the present invention to provide a device and method as characterized above to offer a player the opportunity to effectively compete against the device for a larger reward.

It is a further object of the present invention to provide a device and method as characterized above that allows participation in "progressive" awards even if the player does not have a maximum wager enabled.

It is an object of the present invention to provide a method for gaming, the steps including: receiving a wager to enable the gaming device, enabling a primary display, displaying at least one possible outcome leading to a bonus event, wherein the bonus event is defined by a randomly-numbered grid, oriented in a row-and-column [[(RXC)]] matrix, randomly-generated indicia, first comparison means to determine whether said randomly-generated indicia match any positions on said randomly-numbered grid, and second comparison means to determine whether said matched positions on said randomly-numbered grid correspond to a winning outcome, and awarding credits if a winning outcome is attained.

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 is an example bingo card comprised of a 5x5 row-and-column [[(RXC)]] matrix.

Figure 2 is an example bingo card of Figure 1, containing randomly chosen numbers

Annotated Page -5-

04/10/2008 15:45 14027338489 AMERICAN AMUSEMENTS PAGE 28/49

comprising the first indicia.

Figure 3 is the example bingo card of Figure 2, but also displays example preassigned bonus multipliers.

Figure 4 displays an example ball draw, comprising the second indicia.

Figure 5 displays an example payable with award amounts.

Figure 6 displays an example game, resulting in a bingo bonus value total of 3360 derived from Bingo card of Figure 1 with first indicia of Fig 2 preassigned bonus multiplier vales of Figure 3, the random selection of second indicia of Figure 4 with the paytable of Figure 5, resulting in a winning award to the player of 1x, based on the paytable of Figure 5.

DETAILED DESCRIPTION OF THE INVENTION

In its essence, the device includes a housing, which supports a visual display preferably a video monitor there within. The display may include a window for special messages or for incrementing counting of credits accumulated by the player. The device also includes an LED or other readout for prompting the player and can provide similar verbiage as the window or in lieu thereof, to stimulate the player. The device includes an inlet for the reception therein for coins, currency or the like to auger in the inception of play. A plurality of decision making buttons are located on the face of the apparatus, preferable below the display and a pull handle can be used to initiate play as an alternative to supplement the decision making buttons. A coin hopper or other payment methods, i.e., ticket printers, may be included to effectuate an output of an award due the player. The device may have a top portion with a display thereon having a motif correlative with the game to be played and can include a "pay table", also know as an award card. A plurality of speakers may be included on the device for aural interaction with the player. The apparatus also includes a processor that coordinates all

Annotated Page -6-

04/10/2008 15:45 14027338489 AMERICAN AMUSEMENTS PAGE 29/49

functions, a random number generator operatively coupled thereto for generating outcomes, a read/write instrumentality thereon, and registers with an input output function to record transfer credits and/or update player status.

More specifically, greater details with respect to the video display can be explored with respect to the multiplier bonus. In the preferred embodiment, the display features a plurality of randomly numbered positions in a row-and-column matrix (Figure 1). Numbers for play by the device are randomly generated for play on the matrix (Figure 2). Preferably, the matrix defines a 5x5 array, correlative of BINGO, and above row one depicts the letters "BINGO" defined with positions an alphanumeric display.

Conducive with the preferred embodiment, the player engages in a gaming proposition for which rewards are given for specific outcomes or specific bonus multiplier totals according to a pay table (Figure 5). Regardless of whether a reward is given for the primary outcome, the multiplier bonus uses the display, on which a matrix composed of preassigned numbered positions is present (Figure 3). The center position "O" of the matrix is assigned a high-value bonus amount, which is displayed. The first indicia are randomly generated numbers placed in position within the RC matrix (Figure 2). The second indicia are embodied as a bingo ball having a distinctive numeric or alphanumeric value. Each position on the matrix coincides with only one ball. The second indicia are selected one ball at a time (Figure 4). Thus, the balls are compared to the numbers on the matrix. If the numbers match, then that position appears in contrasting bold, is highlighted, or is "covered" on the matrix. In addition, each "covered" position is assigned a predetermined multiplier bonus amount. Randomly generated numbers continue to appear on the display until a predetermined number or numbers (second indicia) have been generated.

The preferred embodiment contemplates a winning outcome with or without five covered

Annotated Page -7-

04/10/2008 15:45 14027338489 AMERICAN AMUSEMENTS PAGE 30/49

positions along the same row, column, or diagonal of the matrix. Alternatively, a winning outcome could consist only of a matching multiplier bonus value. The multiplier bonus amounts, which correspond to each of the covered spaces (Figure 3) in that matching outcome, are multiplied together, producing a total multiplier value. This total bonus value (Figure 6) is compared to the award card for possible winning amounts (Figure 5). If a winner is made, then the paytable award amount of the bonus multiplier total is won, and is multiplied by the player's initial wager to determine the player's ultimate award due from the bonus game. If the player has not produced a winning outcome on the matrix by the end of the game, the player loses the initial wager and has the option to play the primary game again or to quit and cash out.

The device can be utilized for tournament style play, in which players may compete against each other to acquire a particular type of winning outcome. Such play may also utilize multiple "progressive" awards, with the differing amounts of the awards depending on the amount of the initial wager. That is, one progressive award would be available to players utilizing a maximum wager, while a progressive award of lower value would be available to players utilizing less than a maximum wager.

Thus, awarding of credits may be defined by a plurality of levels of progressive awards, wherein each level is dependent on the number of gaming propositions occurring simultaneously.

Moreover, having thus described the invention, it should be apparent that numerous structural modifications and adaptations may be resorted to without departing from the scope and fair meaning of the instant invention as set forth herein above and as described herein below by the claims.

Annotated Page -8-

CLAIMS

- 1. A game card for playing a game of chance, said game card comprising: a matrix of five rows and five columns defining twenty five grid squares adapted for playing the game of bingo; a bingo, the matrix consisting of a grid known as a bingo card.
- 2. A method for gaming, the steps including: receiving a wager to enable the gaming device, enabling a primary display, displaying randomly selected first indicia within the row-and-column [[(RXC)]] matrix, displaying randomly generated second indicia to be compared to said first indicia the pre-assignment of multiplier values to each position or "spot" within the row-and-column [[(RXC)]] matrix, and leading to a bonus multiplier event, wherein when said randomly generated second indicia match any of the first indicia in any positions on said [[(RXC)]] matrix, the matching position values are multiplied and totaled, resulting in a bonus multiplier total, said total (bonus multiplier total) bonus multiplier total is applied in a second comparison to a predefined corresponding paytable or award card of winning bonus multiplier total amounts, and the awarding credits credits are awarded if a winning outcome is attained.
- 3. The method of claim 2 including assigning of bonus multiplier values to each spot within the row-and-column [[(RXC)]] matrix.
- 4. The method of claim 2 including correlating bonus multiplier totals to a preassigned award to be used in said awarding of credits.

Annotated Page -9-

04/10/2008 15:45 14027338489 AMERICAN AMUSEMENTS PAGE 32/49

- 5. The method device of claim 1 including configuring said randomly numbered grid as a 5 times 5 5 by 5 matrix.
- 6. The method of claim 5 including not assigning the center position of said matrix as a random number [[but]] while always considering it to be a matching position.
- 7. The method of claim 5 including the center position of said matrix is assigned a numbered position.
- 8. The method of claim 5 including preassigning the center position of said matrix a random multiplier bonus adjustment value to be used in said awarding of credits[[.]] wherein.
 - A. the multiplier value remains fixed[[.]] and
 - B. the multiplier value changes through an external stimuli.
- 9. The method of claim 2 including awarding of credits by a plurality of levels of progressive awards, wherein each award level is dependent on the success of a plurality of players simultaneously.
- 10. The device method of claim 2 wherein said second indicia are embodied as bingo balls.
- 11. The method of claim 2, further including assigning a multiplier value to each individual column starting with the "B" row and ending with the "O" row, where each lettered grid square may contain a selected multiplier that would result in a winning[[.]] wherein

Annotated Page -10-

- A. the multiplier value remains fixed[[.]] and
- B. the multiplier value changes through an external stimuli.

Annotated Page -11-

ABSTRACT OF THE DISCLOSURE

A method and device for gaming, in which a primary game is played toward a non-traditional winning outcome, achieved via assignment of multiplier values to each spot on the bingo card (decided in more detail herein). The multiplier bonus differs from the traditional game bingo as follows; by adding new types of possible winning outcomes based on the multiplied total of matching spots on the bingo card or cards, in addition to or in place of, traditional bingo pattern winning outcomes. These devices may utilize "progressive" awards, allowing players to compete against each other for larger awards. Additionally, multiple levels of multiplier bonus awards may be offered, with each level based on the amount of the initial wager.
